

## SUBSTITUTE ABSTRACT

A system for installing a powered device in a downhole tube has a power line extending down a production tube and terminating in a power connector or contact. The powered device toolstring is down the tube and has a corresponding power connector or contact. The two connectors or contacts are aligned as the connector or contact of the line approaches the connector or contact of the tool. Then the two contacts are fitted together such that they make electrical connection when the powered device toolstring is located adjacent to the power connector or contact of the production tube.
